

FOR IMMEDIATE RELEASE:

Reimbursement Services, Inc. Releases Supercharged PECOS Database Search Software Utility

Greer, SC – February 12, 2010 – Reimbursement Services, Inc. (RSI) has released an enhanced PECOS database search utility. The RSI PECOS Database Search Utility is a software program that allows providers to search for individual physicians and also allows the search of an entire list of physicians at once. This is an important feature if you need to search for hundreds of physicians. According to RSI President Brent Mattox, the RSI utility is the only one that provides this feature.

“If your billing software can export the physician file to an Excel spreadsheet format (comma separated value or CSV), the utility can search the entire physician database in just a few seconds and produce a formatted report of unregistered physicians. This eliminates the need to key each search individually and can save hours of valuable staff time.”

The software also has a feature that can search the GEN response report file from CEDI and produce a formatted report of all physician PECOS warnings contained in the file.

The software is available free of charge (registration required) from the RSI web site at www.hmebillingsolutions.com. To access the registration page from the home page, click on the PECOS Software menu item.

Reimbursement Services, Inc. has been providing HME billing services, software, training, and consulting services since 1987.
